FEATURES

| | |
|---|---|
| Sales-based scheduling | <ul style="list-style-type: none">• Establish takt time (the demand rate that sets the pace for production) and drive production directly from customer needs using sales scheduling over multiple time horizons based on fixed, tentative, and forecast commitments.• Establish ability-to-supply and automate customer confirmations or order modifications.• Eliminate handling of physical sales orders with call-off functionality linked to production pull signals. |
| Demand-pull production support | <ul style="list-style-type: none">• Invoke production leveling and sequencing tools such as heijunka boards, constraint loading, and splitting/slotting to improve production flow and accommodate demand spikes.• Eliminate separate production orders and generate assembly or production schedules right from sales orders, then view schedules from book-to-order or cumulative perspectives. |
| Kanban management | <ul style="list-style-type: none">• Employ both point-of-use and pull-on-demand kanbans in production, supplier, and supermarket replenishment systems.• Set both the quantity and level of kanbans on a production cell and select from a variety of triggers, including manual reduction, electronic counters, and back-flushing upon work completion.• Easily monitor kanban status with at-a-glance visual representations to facilitate flow and minimize buffers.• Extend kanban to the supply chain and streamline receipt or booking-in procedures. |
| Process flow tools | <ul style="list-style-type: none">• Automate approval routings and attach electronic signatures to orders or key documents to reduce manual tasks and process delays.• Streamline material movement and increase visibility and inventory control with support for barcode, RFID, or other electronic recording capabilities.• Use the Task Recorder in the Microsoft Windows® Workflow Foundation to easily create user-process documentation for flow or value analysis.• Enable preconfigured materials routing to automate delivery to the appropriate production cells on receipt of a pull signal. |
| Tailored information access through Role Centers | <ul style="list-style-type: none">• Save time, speed decisions, and enable shop floor decision-making by delivering the most relevant information and processes to those who need it.• Enhance productivity and minimize training requirements with a familiar and intuitive user experience and Role Centers that help people quickly find information, prioritize their work, and add value. |
| Notifications and alerts | <ul style="list-style-type: none">• Set up custom notifications to eliminate delays in manual processing, enable real-time decision-making, and keep processes on track.• Use alerts to facilitate faster, more effective responses to changes in orders, inventory levels, material or product quality, performance indicators, and other status triggers. |
| Business intelligence | <ul style="list-style-type: none">• Give managers, operators, and improvement teams visibility into demand and operational performance with tailored reports, dashboards, scorecards, and key performance indicators (KPIs).• Access real-time, role-based information and easily analyze and share the results using familiar tools across the organization and supply chain.• Analyze demand surges or trends, inventory utilization, or other variability using familiar and intuitive analytical tools such as Microsoft Office Excel®.• Transform raw data into actionable information with an embedded, Open Database Compliant (ODBC)-compliant Crystal Reports engine and full integration with SQL Server Reporting Services. |
